1 Serialized record
channel serialization:
ID | name | unit | value
TEP: 52 variables
C-MAPSS: 60 features
Hydraulics: 28 features
2 Input changes
Mapping faults:
cyclic rotation
random derangement
same-unit swap
Intact-pair reorder
Context: background A/B
Known-answer controls:
prospective C / H / R
3 Repeated calls
k calls per input
fresh session per call
ABBA/BAAB: 4 blocks
hydraulics: 5 blocks
Retrospective outputs:
staged freezes
Prospective protocol:
frozen before 27 calls
4 Inference
McNemar + family Holm
case/call intervals
matched-block sensitivity
call-level tests
ABBA: 6 design allocations
stable-difference cases
Fleiss' kappa (repeats)
5 Evaluate policies and retain boundaries
Compare accepted error, coverage, usable correct yield and calls per decision batch
Always-wrong cases cannot be corrected by voting; only same-label cases pass unanimity
Known-answer screening is a candidate call filter; hidden mapping checks remain limited
Observed gains are conditional on reused records, service versions and execution blocks
